US-09-531-056A-23

Sequence 23, Application US/09531056A

Patent No. 6455683

GENERAL INFORMATION:

APPLICANT: Bristol-Myers Squibb Company

TITLE OF INVENTION: DAM MOLECULES. ENCODING HUMAN CLAX PROTEINS AND THEIR SOLUBLE FUSI

TITLE OF INVENTION: PROTEINS

FILE REFERENCE: DB20 NP OWDER: US/09/531,056A

CURRENT APPLICATION UNDER: US/09/531,056A

CURRENT FILING DATE: 2000-03-20

NUMBER OF SEQ ID NOS: 24

SOFTWARE: Patentin version 3.0

A; Note: 146-Arg was also found
C; Comment: This three galactose-binding lectin is isolated from the coelomic fluid.
C; Comment: The protein plays important roles in defense mechanisms and in development C; Comment: The molecule is a terramer of identical chains.
C; Superfamily: tetranectin; C-type lectin homology
C; Keywords: hemolymph; homotetramer; lectin
F; 1-24/Domain: signal sequence #stane productions.

                                                                                                           J. Immunol. 168:240-252(2002).
-!- FUNCTION: Plays a role as a receptor for the recognition of MHC class I HLA-E molecules by NK cells and some cytocoxic T-cells.
-!- SUBDNIT: Can form disulfide-bonded heterodimer with NKG2 family

C-type lectin superfamily member 2 (Activation-induced C-type lectin)
CLECSF2 OR AICL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
-!- SUBCELLULAR LOCATION: Type II membrane protein (Probable).
-!- TISSUE SPECIFICITY: Expressed preferentially in lymphoid tissues, and in most hematopoietic cell types.
-!- SIMILARITY: Contains 1 C-type lectin family domain.
                                                                                                                     Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

"Characterization in rat pancreatic juice of a protein homologous to
the human pancreatic stone protein.";
Comp. Biochem. Physiol. 93B:793-797(1989).
-!- FUNCTION: Might act as an inhibitor of spontaneous calcium
carbonate precipitation.
-!- TISSUE SPECIFICITY: Expressed only in regenerating islets, but
not in normal pancreatic islets, insulinomas or regenerating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     LITHOSTATHINE.

Hoyatine-rich type II antifreeze protein precursor is initiated from the third AUG codon of its mRNA.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDLINE=98206886; PubMed=9537986; Groundly W., Loewen M.C., Lix B., Daugulis A.J., Soemichsen F.D., Groundl W., Loewen M.C., Lix B., Daugulis A.J., Soemichsen F.D., Davies P.L., Sykes B.D.; "The solution structure of type II antifreeze protein reveals a new member of the lectin family."; Biochemistry 37:471(1998).

-i. FUNCTION: Antifreeze proteins lower the blood freezing point.
-i. SIMILARITY: BELONGS TO THE TYPE-II AFP FAMILY. TYPE 2 AFP ARE
Antifreeze protein precursor (AFP).
